Screenshot 1 — Landing Page & Hero

The landing page features the TalentFlow header, hero headline, and the 5-step progress indicator. Step 1 (Personal Information) is active — shown in blue. The job position dropdown is visible at the bottom.

Project Overview

TalentFlow Recruitment Wizard is a fully client-side, multi-step job application form that simulates a real-world HR intake workflow. Built with **HTML5**, **CSS3**, **Bootstrap 5**, and **vanilla JavaScript** — no backend, no npm packages, no build tools. Open **index.html** in any browser and it works. Deployed live on GitHub Pages and built as a portfolio showcase of modern form UX, dynamic DOM manipulation, and client-side state management without any framework.

5-Step Application Wizard

Each step validates required fields before advancing. Users can go back freely. Step 5 shows a complete application summary before final submission. After submitting, a personalised success screen appears with an "Apply for Another Job" button.

Screenshot 2 — 5-Step Progress Navigator

The progress navigator highlights the active step in blue and marks completed steps in green. Step 1 (Personal) is active. The job role dropdown shows '— Select an IT Role —' with 15 curated IT positions.

Key Features

IT Job Dropdown

15 curated roles — DevOps, ML, QA, Cloud, and more

Multi-Add Certifications

AWS/Google/MS certs with Credential IDs

Skill Tag Input

Enter or comma to add tags; backspace to remove

Auto-Save

All state saved to localStorage — resumes on refresh

Application Review

Step 5 shows full structured summary before submit

XSS Protection

escHtml() sanitises all user input before rendering

Multi-Add Education

Unlimited degree entries: Degree, Institution, Year, GPA

Multi-Add Work History

Job title, company, date range, current-role toggle

CV File Preview

Inline green badge confirms upload instantly

Toast Notifications

Non-blocking alerts replace all browser popups

Apply Another Job

Resets entire wizard cleanly without page reload

Fully Responsive

Mobile, tablet & desktop — Bootstrap 5 grid

Screenshot 3 — Step 5: Review & Submit Screen

The screenshot shows a web browser window with the URL <https://hadibaig.github.io/web-projects-showcase/html-css-js/TalentFlow->. The page title is "TalentFlow Recruitment Application Wizard". The main heading is "Review & Submit" with a subtext "Please review your application before submitting." Below this, there are several sections:

- APPLYING FOR**: Full Stack Developer
- PERSONAL INFORMATION**:

FULL NAME	EMAIL	PHONE	COUNTRY
Jhon	mirzahadi@hotmail.com	0333333333	US
CITY	LINKEDIN	RESUME	
NY	—	Mirza_Hadi_CV-2026.pdf	
- EDUCATION**: No education entries added.
- CERTIFICATIONS**

The Review screen organises all entered data into clearly labelled sections: Applying For, Personal Information, Education, Certifications, Experience, and Skills. The applicant reviews everything before hitting Submit.

Screenshot 4 — Application Submitted! Success Screen

After submission, a personalised confirmation screen appears showing the applicant's name, applied role, email, and summary pills (location, availability, years of experience). "Apply for Another Job" fully resets the wizard to Step 1.

File Structure

File	Role
index.html	All markup — header, progress bar, 5 step panels, success screen. Zero logic.
style.css	All visual design — CSS variables, layout, animations, responsive rules.
script.js	All JS logic — state, navigation, validation, multi-add, save/load, review.
DOCS.html	Interactive developer guide explaining every function and customisation.
README.md	GitHub readme with features table, v1 vs v2 comparison, deployment steps.

Core Functions Reference

Function	Purpose
<code>showStep(index)</code>	Hides all steps, reveals target step, updates progress circles, auto-saves
<code>validateStep(index)</code>	Checks required fields per step — blocks navigation if any check fails
<code>generateReview()</code>	Builds full Step 5 summary HTML from all state arrays and field values
<code>saveFormData()</code>	Serialises all fields + arrays to localStorage on every input event
<code>loadSavedData()</code>	Reads localStorage on page load — restores all fields, arrays, and current step
<code>addEducationEntry()</code>	Pushes new object into educationEntries array, re-renders the list
<code>addCertEntry()</code>	Pushes new object into certEntries array, re-renders the list
<code>addWorkEntry()</code>	Pushes new object into workEntries array, re-renders the list
<code>initSkillTags()</code>	Wires Enter / comma / backspace / blur events on the skill tag input
<code>resetWizard()</code>	Clears all state, resets all fields, re-renders empty lists, returns to Step 1
<code>showToast(msg, type)</code>	Non-blocking bottom-right notification (success / warning / danger / info)
<code>escHtml(str)</code>	Sanitises user input before inserting into innerHTML — prevents XSS attacks

Notable Bug Fix — Submit Button on GitHub Pages

Problem	Submit button used <code>type="submit"</code> . On GitHub Pages, the browser's HTML5 native validation runs across all inputs — including the hidden file input from Step 1. This silently blocked the submit event.
Root Cause	HTML5 native form validation does not skip hidden or off-screen fields. The form spans 5 steps and the CV file input in Step 1 was technically empty at submit time.
Fix Applied	Changed to <code>type="button"</code> (disables all browser-native validation). Moved all submit logic to a direct click event listener on the button. A bare <code>form.addEventListener("submit", e => e.preventDefault())</code> blocks accidental Enter-key submissions.
